lite on the environment

The same properties of durability and flexibility which make the lite modular exhibition and display system so adaptable and easy to use ensure that lite also meets the highest environmental standards.

With waste representing a major environmental challenge within the exhibition industry, we are continually improving our performance on managing and reducing waste.

The lite modular exhibition and display system has been designed and produced, according to current best practice in environmental awareness, to be durable, lightweight and instantly reusable for many 3D marketing and display applications.

However individual the display, with lite there is no need to break it down and throw it away. It can be built and rebuilt over and over again - for roadshows and exhibitions, conference sets, showrooms and display areas.

Flexible, clean and easy to install, the lite system of individual straight and curved panels allows for endless creativity and is totally interchangeable.

Individual panels can simply be redressed with new graphics without the need to replace them, making both economic and environmental sense. lite is designed to last, but should an individual panel get damaged, then it can be easily replaced and recycled.

lite is increasingly being stored and sourced locally in a growing number of countries, further reducing the need for unnecessary packaging and delivery.

But, where necessary, lite is durable enough to withstand the stresses of travel and light enough to create a minimal carbon footprint.

And, should a lite system ever reach the end of its long and useful life, then its plastic components can be completely recycled, making lite light on budgets and light on the environment.
